Washington, DC The USACE quietly and without coordination with industry released an update to EM 200-1-015, Technical Guidance For Military Munitions Response Actions. The changes to the Engineer Manual primarily include the addition of quality processes involving geophysical systems which "are required to provide defensible data that can support environmental decisions when characterizing munitions response sites and when making risk management decisions involving MEC." The changes also attempt to minimize performance deficiencies known to exist in products from analog geophysical methods such that they are not precluded from consideration in environmental risk management decisions.

The updated EM 200-1-015 dated October 30, 2018 can be downloaded from UXOInfo.com.
