About FLIR's Unmanned Ground Systems

A unit of FLIR Systems, Inc., FLIR Unmanned Ground Systems is the world's leading provider of battle-tested Unmanned Ground Vehicles (UGVs). We partner with U.S. and international military, law enforcement and industrial users to design and build technologically advanced robots that support a wide range of missions. Whether it's a roadside bomb on the battlefield, a suspicious package on the subway, or a potential hazmat situation, our robots help keep troops, first responders, and the public safe.

FLIR has delivered more than 7,000 UGVs to customers in over 55 countries. Ranging in size from five to 500 pounds, our trusted robots have been used countless times in the field to provide a greater stand-off distance from danger. Using an array of sensors, they gather valuable intelligence so decision-makers can better understand the situation and respond to possible threats. Our family of UGVs are modular, adaptable, easy-to-use, and meet or exceed the needs of operators in any uniform.
