## EXECUTIVE SUMMARY

The United States (U.S.) Army is conducting qualitative assessments at operational ranges to meet the requirements of Department of Defense policy and to support the U.S. Army Sustainable Range Program. The operational range qualitative assessment (hereinafter referred to as Phase I Assessment) is the first phase of the U.S. Army Operational Range Assessment Program. This Phase I Assessment evaluates the operational range area at Five Mile Training Area (TA) to assess whether further investigation is needed to determine if potential munitions constituents of concern (MCOC) are or could be migrating off-range at levels that may pose an unacceptable risk to human health or the environment. In conducting the Phase I Assessment, MCOC sources, potential off-range migration pathways, and potential off-range human and ecological receptors are evaluated as appropriate.

According to the Army Range Inventory Database-Geodatabase (2006), Five Mile TA consists of one operational range (light training and maneuver area), which encompasses approximately 856.26 acres in Montgomery County, Illinois. The site is composed of two noncontiguous parcels of land owned by the city of Litchfield, Illinois. One parcel is located two and one-half miles north of the city of Litchfield, and the second parcel is located just northeast of the city on Lake Lou Yaeger. The Illinois Army National Guard (ILARNG) is only known to have used the parcel on Lake Lou Yaeger for training.

Light maneuver training activities are conducted at Five Mile TA. A review of available records and background data, as well as interviews with ILARNG personnel, indicates that training activities at Five Mile TA do not involve, and historically have not involved, the use of military munitions except for small caliber blanks. Small caliber blanks contain no projectile and are not considered to be a source of MCOC. Potential sources of MCOC were not identified at Five Mile TA; therefore, potential off-range migration pathways and potential off-range human and ecological receptors were not evaluated. The training and maneuver area at Five Mile TA is categorized as Unlikely.

Installations with operational ranges where no munitions or only small caliber blanks have been utilized are categorized as Unlikely. That is, based on a review of available information, there is sufficient evidence to show that due to the lack of munitions use there are no known releases or source-receptor interactions that could present an unacceptable risk to human health or the environment. Ranges categorized as Unlikely are required to be re-evaluated at least every five years. Re-evaluation may occur sooner if significant changes (e.g., change in range operations or site conditions, regulatory changes) occur that affect determinations made during this Phase I Assessment. **Table ES-1** summarizes the Phase I Assessment findings.

**Table ES-1: Summary of Findings and Conclusions for Five Mile TA**

Category	Total Number of Ranges and Acreage	Source(s)	Pathway(s)	Human and Ecological Receptors	Conclusions
Unlikely	One operational range; 856.26 acres	No source—no current or historical use of live-fire military munitions	Not evaluated (no source identified)		Re-evaluate during the five-year review.
